June 7, 2020

Residual Block

- Very, very deep NNs are difficult to train because of vanishing and exploding gradients problems.
- Residual network also be know as skip connection.
- skip connection makes you take the activation from one layer and suddenly feed it to another layer even much deeper in NN which allows you to train large NNs even with layers greater than 100.

$$z^{[l+1]} = W^{[l+1]} a^{[l]} + b^{[l+1]}$$

$$a^{[l+1]} = g(z^{[l+1]})$$

$$z^{[l+2]} = W^{[l+2]} a^{[l+1]} + b^{[l+2]}$$

~~$$a^{[l+2]} = g(z^{[l+2]})$$~~

$$a^{[l+2]} = g(z^{[l+2]} + \underbrace{a^{[l]}})$$

Residual Network

$$a[l + 2] = g(z[l + 2] + a[l]) \quad (1)$$

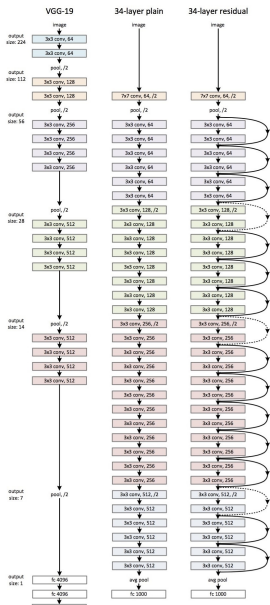

$$= g(W[l + 2]a[l + 1] + b[l + 2] + a[l]) \quad (2)$$

We we apply L2 regularization we obtain :

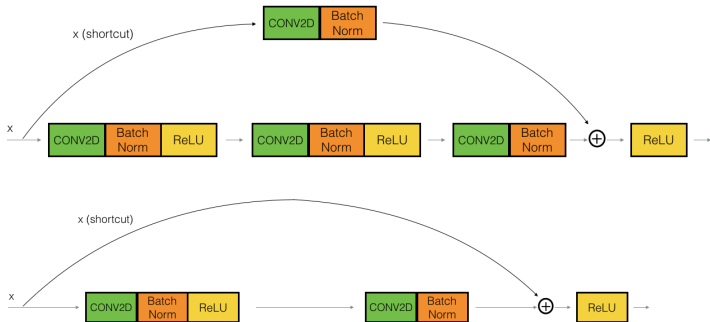

$$a[l + 2] = g(a[l]) = a[l] \quad (3)$$

- This show that identity function is easy for a residual block to learn. And that why it can train deeper NNs.
- ResNets or Skip connections can be used to solved the vanishing and exploding gradient problem.

ResNet-34

Implementation of Residual Network
